8 Spherical roller bearings

Designs and variants

Spherical roller bearings have two rows of rollers, a common sphered outer ring raceway and two inner ring raceways inclined at an angle to the bearing axis (→ **fig. 1**). The centre point of the sphere in the outer ring raceway is at the bearing axis. Therefore, the bearings are self-aligning (→ **fig. 2**) and insensitive to misalignment of the shaft relative to the housing, which can be caused, for example, by shaft deflection. Spherical roller bearings are designed to accommodate heavy radial loads, as well as heavy axial loads in both directions.

Factors that influence SKF spherical roller bearing performance

Bearing performance is not only determined by load or speed ratings. There are a number of other factors that contribute to bearing performance. To a large extent, performance is influenced by the geometry of the rollers, raceways and cages, the heat treatment, as well as the surface finish of all contact surfaces. Main factors which influence SKF spherical roller bearing performance include, but are not limited to:

- **Symmetrical rollers**
  Symmetrical rollers self-adjust (→ **fig. 3**), providing optimal load distribution along the roller length. This keeps stresses low under all load conditions and extends bearing service life.

- **Roller tolerances**
  The rollers in an SKF spherical roller bearing are manufactured to extremely tight tolerances for dimension and form. Each roller is virtually identical in size and shape to the other rollers in the set. This optimizes load distribution over the rollers to maximize bearing service life.

- **Special roller profile**
  The roller profile determines the stress distribution in the roller/raceway contact area. The special profile distributes loads more evenly along the rollers and prevents stress peaks at the roller ends to extend bearing service life (→ **fig. 4**).

- **Self-guiding rollers and a guide ring between the two rows of rollers**
  Self-guiding rollers reduce friction and frictional heat (→ **fig. 5**). A guide ring guides unloaded rollers so that they enter the load zone in the optimal position.

- **Metal cages**
  All SKF spherical roller bearings contain strong metal cages. This enables them to tolerate high temperatures and all lubricants.

Assortment

The assortment of SKF spherical roller bearings is the widest on the market and includes standard bearings and application specific bearings. Almost all SKF spherical roller bearings are available with either a cylindrical or tapered bore. Depending on the bearing series, the tapered bore has a taper of either 1:12 (designation suffix K) or 1:30 (designation suffix K30).

The assortment of standard bearings includes:

- basic design bearings
- sealed bearings
- bearings for vibratory applications
- SKF Energy Efficient (E2) bearings

Spherical roller bearings listed in this catalogue constitute the basic SKF assortment and are only part of the total assortment. For applications where the bearings are subjected to unique operating conditions, SKF can customize bearings to meet the needs of that particular application. For example, bearings for:

- printing presses, paper mills or coaters in high precision execution
- very arduous operating conditions, e. g. continuous casters
- high temperature applications
- mounting with loose fit on roll necks
- railway vehicles

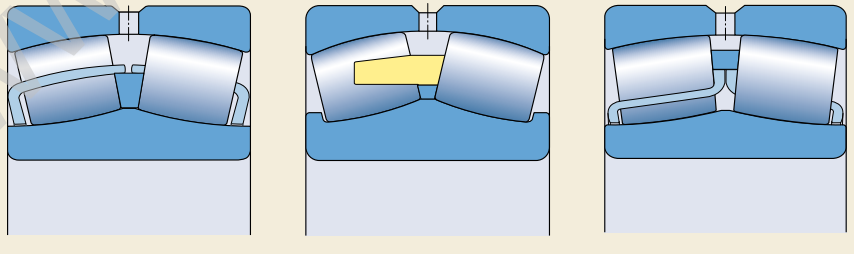
For additional information about application specific spherical roller bearings, contact the SKF application engineering service.

Basic design bearings

Depending on their series and size, standard SKF spherical roller bearings are manufactured to one of following basic designs (→ **fig. 6**):

- CC design bearings have two stamped window-type steel cages, an inner ring without flanges and a guide ring centred on the inner ring. The CC design is indicated by the designation suffix C or CC. Large CC design bearings with the designation suffix EC or ECC have an optimized internal design for increased load carrying capacity.
- CA design bearings have a machined double prong-type brass cage, an inner ring with a retaining flange on both sides and a guide ring centred on the inner ring. The flanges on the inner ring are designed to keep the rollers in place when swivelling the bearing during installation or maintenance. The flanges are not designed to guide the rollers or accommodate any axial load. The CA design is indicated by the designation suffix CA. Large CA design bearings with the designation suffix ECA have an optimized internal design for increased load carrying capacity.

Fig. 6



CC design | CA design | E design

- E design bearings have two stamped window-type steel cages, an inner ring without flanges and a guide ring centred on the inner ring ($d \leq 65$ mm) or on the cages ($d > 65$ mm). They have an annular groove and three lubrication holes in the outer ring. E design bearings are indicated by the designation suffix E. All E design bearings have an optimized internal design for increased load carrying capacity.

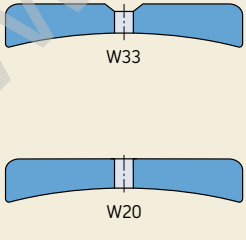
Annular groove and lubrication holes

SKF spherical roller bearings are available with an annular groove and three lubrication holes in the outer ring (designation suffix W33) or three lubrication holes in the outer ring (designation suffix W20) (→ **fig. 7**). SKF E design bearings (→ **fig. 6**) and SKF Energy Efficient (E2) bearings have an annular groove and three lubrication holes as standard and therefore, the W33 designation suffix is not necessary.

Cages

Cages in SKF spherical roller bearings are an integral part of the bearing internal design. Depending on their internal design, series and size, SKF spherical roller bearings are fitted with one of the cages shown in **fig. 6**. For additional information about the suitability of cages, refer to *Cages* (→ **page 37**) and *Cage materials* (→ **page 152**).

Fig. 7



Sealing solutions

With the exception of bearings designated with a BS2- prefix, the boundary dimensions of sealed spherical roller bearings are in accordance with ISO 15. Bearings with a BS2- prefix, for example BS2-2214-2CS, are based on 222 E or 223 E series bearings, but are slightly wider to accommodate the seals.

Sealed spherical roller bearings have the same features and internal design as basic design spherical roller bearings and are available with a cylindrical bore as standard. Some sizes are also available with a tapered bore or can be supplied with a tapered bore on request.

Sealed spherical roller bearings have a contact seal reinforced with a sheet steel insert, fitted on both sides. They can also be supplied with a seal on only one side. The bearings can be fitted with seals made of one of the following materials:

- NBR (designation suffix CS)
- HNBR (designation suffix CS5)
- FKM (designation suffix CS2)

The seals are fitted in a recess on the outer ring and seal against the inner ring. On larger bearings, the seals are fixed by a retaining ring (→ **fig. 8**).

Sealed spherical roller bearings are supplied lubricated and should not be washed. For many application conditions, the bearings do not require relubrication and can be considered relubrication-free (→ *Relubrication of sealed bearings*).

SKF does not recommend heating sealed spherical roller bearings above 80 °C *(175 °F)* during the mounting process. However, if higher temperatures are necessary, make sure that the temperature does not exceed the permissible temperature of either the seal or grease, whichever is lowest.

WARNING
Seals made of FKM (fluoro rubber) exposed to an open flame or temperatures above 300 °C *(570 °F)* are a health and environmental hazard! They remain dangerous even after they have cooled.

Read and follow the safety precautions under *Seal materials* (→ **page 155**).

Greases for sealed bearings

Sealed spherical roller bearings are filled as standard with SKF LGEP 2 grease. Bearings filled with SKF LGHB 2 grease can be supplied on request. Technical specification of both greases are listed in **table 1**.

For additional information about greases, refer to *Lubrication* (→ **page 239**).

Relubrication of sealed bearings

Sealed spherical roller bearings are designed to operate relubrication-free. For bearings lubricated with the standard grease LGEP 2 (designation suffix VT143), the relubrication-free operating conditions can be identified using **diagram 1**. The diagram is valid for bearings in light to normal load applications ($P \leq 0{,}1\ C$) on a horizontal shaft and a load ratio $F_a/F_r \leq e$. For other operating conditions, the grease life can be estimated by multiplying

the relubrication interval for open bearings (→ *Relubrication*, **page 252**) by a factor of 2,7.

In applications that have a life requirement outside the green area of **diagram 1** (→ **page 885**), the bearings may require relubrication.

A suitable grease quantity to relubricate sealed bearings can be obtained using

$$G_p = 0{,}0015\ D\ B$$

where
G_p = grease quantity [g]
D = bearing outside diameter [mm]
B = bearing width [mm]

The grease should be applied slowly through the lubrication holes in the outer ring while the bearing is rotating, if possible, to avoid damaging the seals. SKF recommends relubricating with the same grease as the initial fill.

Bearings for vibratory applications

For vibratory applications, SKF supplies spherical roller bearings with a cylindrical or tapered bore and surface-hardened stamped steel cages (series designations 223../VA405). These bearings have the same dimensions and performance characteristics as basic design bearings, but have C4 radial internal clearance as standard.

Bearings for vibratory applications are also available with a PTFE coated cylindrical bore (designation suffix VA406). These bearings are manufactured to VA405 specifications, with the exception of the bore. VA406 bearings are intended for the non-locating bearing position in vibratory applications with outer ring rotation. The PTFE coating prevents fretting corrosion between the shaft and the bearing bore. Therefore, shafts do not require special heat treatments or coatings.

All bearings are equipped with an annular groove and three lubrication holes in the outer ring.

Depending on their size, SKF spherical roller bearings for vibratory applications are manufactured to one of following designs (→ **fig. 9**):

- E/VA405 spherical roller bearings have two surface-hardened stamped window-type steel cages, an inner ring without flanges and a guide ring centred on the inner ring or on the cages.
- EJA/VA405 and CCJA/W33VA405 spherical roller bearings have two surface-hardened stamped window-type steel cages, an inner ring without flanges and a guide ring centred on the outer ring raceway.

WARNING
PTFE coatings exposed to an open flame or temperatures above 300 °C *(570 °F)* are a health and environmental hazard! They remain dangerous even after they have cooled.

Read and follow the safety precautions under *Seal materials* (→ **page 155**).

Acceleration

Vibratory applications, such as vibrating screens or exciters, induce accelerations of rollers and cages in the bearings. This puts extra demands on the bearing design. SKF spherical roller bearings for vibratory applications can withstand considerably faster accelerations than corresponding standard bearings. The permissible acceleration depends on the lubricant and the mode of acceleration.

- Mode 1
  The bearing is subjected to a rotating outer ring load in combination with a rotating acceleration field, or an internally induced angular acceleration field due to rapid speed variations. These accelerations cause the unloaded rollers to generate cyclic loads on the cages.

- Mode 2
  The bearing is subjected to impact loads, which generate a linear acceleration in a constant radial direction, causing the unloaded rollers to "hammer" the cage pockets.

Typical examples for mode 1 are vibrating screens (→ **fig. 10**), planetary gears and general arrangements subjected to rapid starts or rapid speed variations. A typical example for mode 2 is the acceleration generated when rail wheels roll over rail joints (→ **fig. 11**). Road rollers, where the roller is vibrating against a relatively hard surface, are subjected to a combination of mode 1 and 2 acceleration.

Values for the permissible acceleration are listed in the product tables and are valid for oil lubricated bearings. The values are expressed in multiples of g, where g is the acceleration of gravity (g = 9,81 m/s^2).

System solutions for vibrating screens

In addition to single bearings for vibrating screens, SKF has developed fault detection and bearing systems that can improve performance, reduce maintenance and monitor machine condition in vibratory equipment. Performance classes

SKF Explorer bearings

In response to the ever-demanding performance requirements of modern machinery, SKF developed the SKF Explorer performance class of rolling bearings.

SKF Explorer spherical roller bearings realized this substantial improvement in performance by optimizing the internal geometry and surface finish of all contact surfaces, combining the extremely clean and homogenous steel with a unique heat treatment, improving the cage, roller profile and the geometry of the raceways.

These improvements provide the following benefits:

- higher dynamic load carrying capacity compared to conventional design bearings
- improved wear-resistance
- reduced noise and vibration levels
- less frictional heat
- significantly extended bearing service life

SKF Explorer bearings reduce environmental impact by enabling downsizing and reducing both lubricant and energy use. Just as importantly, SKF Explorer bearings can reduce the need for maintenance and contribute to increased productivity.

SKF Explorer bearings are shown with an asterisk in the product tables. The bearings retain the designation of earlier standard bearings. However, each bearing and its box are marked with the name “SKF EXPLORER”.

SKF Energy Efficient (E2) bearings

To meet the ever-increasing demand to reduce friction and energy use, SKF has developed the SKF Energy Efficient (E2) performance class of rolling bearings. SKF E2 spherical roller bearings are characterized by a frictional moment in the bearing that is at least 30% lower when compared to a same-sized SKF Explorer bearing.

Reduced operating temperatures improve lubrication conditions and enable extended lubrication intervals or higher speeds.

The enhanced performance characteristics require the following conditions:

- speed n > 500 r/min
- operating temperature ≤ 110 °C *(230 °F)*
- load P ≤ 0,067 C
- lubrication and relubrication with SKF LESA 2 grease only (**→ table 2**).

For loads P > 0,067 C, SKF Explorer bearings are more beneficial.

Examples are:
– vibrating screens with rotating imbalance and therefore rotating deflection of the shaft (→ **fig. 12**)
– deflection-compensating rolls of paper machines where the stationary shaft is bent

- To avoid detrimental effects on sealing performance, misalignment for sealed bearings should not exceed 0,5°.

For additional information (→ **page 86**)	The weight of the components supported by the bearing, together with external forces, generally exceed the requisite minimum load. If this is not the case, the bearing must be subjected to an additional radial load.
Axial load carrying capacity	SKF spherical roller bearings are able to accommodate heavy axial loads and even purely axial loads.
	Bearings mounted on an adapter sleeve on smooth shafts without fixed abutment: $F_{ap} = 0{,}003\ B\ d$ Provided the bearings are correctly mounted.
Equivalent dynamic bearing load For additional information (→ **page 85**)	$F_a/F_r \leq e \rightarrow P = F_r + Y_1 F_a$ $F_a/F_r > e \rightarrow P = 0{,}67\ F_r + Y_2 F_a$
Equivalent static bearing load For additional information (→ **page 88**)	$P_0 = F_r + Y_0 F_a$

Temperature limits

The permissible operating temperature for spherical roller bearings can be limited by:

- the dimensional stability of the bearing rings
- the seals
- the lubricant

When temperatures outside the permissible range are expected, contact the SKF application engineering service.

Bearing rings

SKF spherical roller bearings undergo a special heat treatment. The bearings are heat stabilized for use at temperatures up to 200 °C *(390 °F)* for at least 2 500 h, or for brief periods at even higher temperatures.

Seals

The permissible operating temperature for seals depends on the material:

- NBR seals:
  –40 to +90 °C *(–40 to +195 °F)*
  Temperatures up to 120 °C *(250 °F)* can be tolerated for brief periods.
- HNBR seals:
  –40 to +150 °C *(–40 to +300 °F)*
- FKM seals:
  –30 to +200 °C *(–20 to +390 °F)*

Lubricants

Temperature limits for the greases used in SKF spherical roller bearings are provided in **table 1** (→ **page 885**) for sealed bearings and in **table 2** (→ **page 889**) for SKF E2 bearings. Temperature limits for other SKF greases are provided under *Lubrication* (→ **page 239**).

When using lubricants not supplied by SKF, the temperature limits should be evaluated according to the SKF traffic light concept (→ **page 244**).

Permissible speed

The permissible speed can be estimated using the speed ratings listed in the product tables and applying the information provided under *Speeds* (→ **page 117**). If no reference speed is listed in the product tables, the limiting speed is the permissible speed.

To achieve their special performance characteristics, SKF E2 spherical roller bearings must operate at speeds above the recommended minimum speed of 500 r/min.

Design of bearing arrangements

Free space on both sides of the bearing

To prevent interference between rotating and stationary components, the abutment diameter on the shaft should be < d_2 and in the housing > D_1 (→ **fig. 13**). Values for d_2 and D_1 are listed in the product tables.

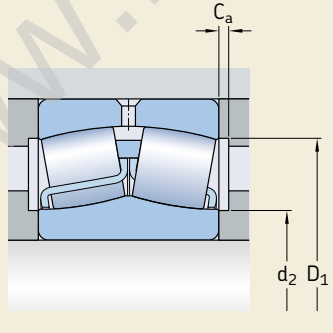
The necessary width of the free space C_a depends on:

- the actual misalignment
- the possible protrusion of the cage from the side face of the bearing for some bearing sizes
- lubrication requirements

That requisite free space should be at least 20 times the minimum value of the radial internal clearance in the unmounted bearing (→ **table 4**, **page 892** or **table 5**, **page 893**).

For additional information, contact the SKF application engineering service.

Fig. 13



Abutments for sealed bearings

The diameter of the shaft abutment should not exceed $d_{a\,max}$ (→ **product tables**) at least for the 1 to 2 mm closest to the bearing, to prevent interference with the seal (→ **fig. 14**). If the bearings are to be located axially on the shaft by a lock nut, SKF recommends using a KMFE lock nut (→ **fig. 15**) or a spacer ring (→ **fig. 16**) between the bearing and the lock washer to prevent interference with the seal.

Bearings on sleeves

Spherical roller bearings with a tapered bore can be mounted on plain or stepped shafts with an adapter sleeve (→ **fig. 17**) or on stepped shafts with a withdrawal sleeve (→ **fig. 18**). Adapter sleeves are supplied complete with a locking device. For additional information about sleeves, refer to *Bearing accessories* (→ **page 1269**).

When using sealed spherical roller bearings on an adapter sleeve, the locking device must not interfere with the seal. To avoid this, use an appropriate SKF adapter sleeve assembly for sealed bearings (→ **fig. 19**), as listed in the product tables (→ **page 954**). Alternatively, a spacer ring can be inserted between the bearing and the lock washer.

Appropriate bearing housings

The combination of a spherical roller bearing, appropriate sleeve, where needed, and an appropriate SKF bearing housing provides a cost-effective, interchangeable and reliable solution that fulfils the demand for easy maintenance. Appropriate SKF housings are available in a variety of designs and sizes for a wide range of applications. The designs include:

- split and non-split plummer (pillow) block housings
- flanged housings
- take-up housings

Additional information about SKF bearing housings is available online at skf.com/housings.

Mounting

Due to the design of spherical roller bearings, the rings and roller complement may be displaced axially from the normal position during handling. Therefore, SKF recommends mounting spherical roller bearings when the shaft or housing is in the horizontal position. Also, whenever possible, rotate the inner or outer ring to align the rollers during mounting.

If spherical roller bearings are mounted when the shaft or housing is in the vertical position, the roller complement, together with the inner or outer ring will move downward until there is no more clearance. Then, when the bearing rings expand or contract as a result of an interference fit, a preload is likely to result. To prevent this preload condition from occurring, rotate the inner or outer ring during installation. If this is not feasible, use a bearing handling tool or other device to keep the bearing components arranged centrally.

Mounting bearings with a tapered bore

Bearings with a tapered bore are always mounted with an interference fit. To obtain the proper degree of interference, one of the following methods can be used:

1 measuring the clearance reduction
2 measuring the lock nut tightening angle
3 measuring the axial drive-up
4 applying the SKF Drive-up Method
5 measuring the inner ring expansion (SensorMount)

For additional information about these mounting methods, refer to *Mounting, dismounting and bearing care* (→ **page 271**), or the *SKF bearing maintenance handbook*.

For bearings with d > 100 mm, SKF recommends using the SKF Drive-up Method. This is a fast, reliable and safe method to achieve the appropriate interference fit. Additional information is available online at skf.com/drive-up.

Recommended values to apply methods 1 to 3 are listed in **table 7**.

NOTE: Applying the recommended values prevents the inner ring from creeping, but does not ensure correct radial internal clearance in operation. Additional influences from the bearing housing fit and temperature differences between the inner and outer rings must be considered carefully when selecting the bearing radial internal clearance class. For additional information, contact the SKF application engineering service.

[2)] The listed values are to be used as guideline values only, as it is difficult to establish an exact starting position. Also, the axial drive-up s differs slightly between the different bearings series.
